ABSTRACT

A method and system automatically generate a list of participants physically present at a meeting and distribute permission to the participants. Identity and key information is collected from the participants during the meeting using at least one personal area network. The identity and key information is stored on a delegation device. Permission to access the services is distributed to the participants over at least one personal area network using the delegation device. The delegation device may include an access control matrix or moveable icons for organizing and distributing participant and permission information.
